

DSP-22-1

Low Power, Single Channel Vehicle Detector for DoorKing Operators

The DSP-22-1 detector is designed to be a low power, direct replacement for the existing DoorKing Model 9410 single channel inductive loop vehicle detectors for the parking and access control industries. The DSP-22-1 loop detector plugs into the loop detector ports on the DoorKing operator control board.

The DSP-22-1 operates as a single channel detector. The DSP-22-1 is a detector that uses advanced channel scanning technology to provide superior noise tolerance.

The DSP-22-1 always operates in the Fail-safe mode of operation.

The DSP-22-1 continually monitors the loop circuit looking for conditions that would signify a fault in the loop circuit and displays the type of fault identified. This helps quickly identify open or shorted loops. Fault memory alerts the user to past faults that have automatically been recovered.

Features

- ❖ Very low power. Typically draws less than 700 microamps.
- ❖ Advanced technology with superior noise tolerance.
- ❖ Selectable Presence or Pulse operation.
- ❖ 4 selectable sensitivity settings and sensitivity boost allow for a wide range of uses.
- ❖ Loop monitoring provides a fault display when a loop failure is detected.
- ❖ Fault memory gives a unique display when a fault has occurred, but the system is currently functioning properly.
- ❖ Supports the Mini-Loop Probe and provides unique flicker display for detection during pulse operation.

The DSP-22-1 has a new unique flicker display that helps insure correct operation of channel 1 when it is operating in the pulse mode. The channel 1 detect LED will turn on while the pulse is being outputted; then the LED display will go into a unique flicker mode while the channel is still detecting the vehicle. This allows easy identification of a locked-up channel operating in the pulse mode.

Channel 1 of the DSP-22-1 can be connected to a standard inductive loop or the Diablo Controls Mini-Loop Probe. The Mini-Loop Probe is a small round device approximately 4-1/2" long by 1" in diameter utilizing a 2-wire direct burial rated cable. It is designed to be buried in the center (optimum) or side of roadway to detect vehicles. Two Mini-Loop Probes can be wired in series to gain detection area. Contact Diablo Controls for more information on the Mini-Loop Probe. The Mini-Loop Probe can only operate in a pulse mode and therefore can never be used as a safety or obstruction sensor.

DSP-22-1 Low Power, Single Channel Vehicle Detector for DoorKing Operators

SELECTABLE FEATURES

DIP Switch 1 & 2 – Channel 1 Sensitivity:

1	2	Function
OFF	OFF	Channel 1 Sensitivity is 0.32% $\Delta L/L$
ON	OFF	Channel 1 Sensitivity is 0.16% $\Delta L/L$
OFF	ON	Channel 1 Sensitivity is 0.08% $\Delta L/L$
ON	ON	Channel 1 Sensitivity is 0.04% $\Delta L/L$

DIP Switch 3 – Channel 1 Sensitivity Boost: Setting this switch to ON increases the sensitivity of channel 1 after initial detection. This feature is useful in the detection of high-bed vehicles.

DIP Switch 4 – Channel 1 Presence / Pulse: When this switch is OFF the presence mode of operation is selected for Channel 1. The output will remain activated as long as a vehicle is in the detection zone. When the switch is ON the pulse mode of operation is selected for Channel 1. The pulse mode used is commonly referred to as Pulse On Entry. Channel 1 will output a pulse when a vehicle is first detected and will not output again until the loop is no longer occupied.

DIP Switch 5 – Channel 1 Loop Type: When set to OFF, Channel 1 is configured to operate with a normal inductive loop. Set the switch to ON to operate with a Diablo Controls Mini-Loop Probe. The probe mode will always be an entry pulse. As such, it is perfect for free exit operation. Never use the probe mode for a safety (obstruction) loop.

Extended Presence: The detector will use an extended presence mode of operation. This mode allows for strong detections that can be held for very long periods of time (days or even weeks) as long as power is not interrupted and very weak detections to be held for about 15 minutes.

Fail Safe: The detector operates in the fail-safe mode of operation if a loop failure is detected. This means that the output will remain active as long as the loop is in failure.

INDICATORS

Green Power LED: The green power LED will be on whenever the detector is operating in the full power mode. Full power mode occurs whenever a possible vehicle has been detected, any channel is in detect, or any loop has failed. When the detector is operating normally without a loop failure and no vehicle detected, the LED will blink on once every two seconds to indicate that it is operating in the low power mode.

Red Channel LED: The red LED will indicate the status of the detector. Occupancy, Pulse outputs, Loop Failures, and Past Failures are all displayed on this LED.

Indicator Test: All three LEDs will turn on and then off momentarily as a lamp test each time the unit is reset.

SPECIFICATIONS

Loop Inductance: 20 μ H to 1500 μ H (including lead-in inductance)

Operating Temperature: -35°F to 165°F (-37°C to 74°C)

Operating Voltage: 14 volts to 27 volts DC

Operating Current:

No Detect	0.69 milliamps typical @ 20VDC.
In Detect	26.43 milliamps typical @ 20VDC.

Response Time: 152 ms typical. 280 ms worst case.

Frequency Settings: There are four settings per channel. The actual loop frequency is dependent on loop circuit inductance. The detector uses a channel scanning technology to minimize noise interference.

Pulse Output: 250ms on period followed by a 250ms off period before the next pulse can begin
